Supplementary Information: Navigating Fairness and Privacy

ANONYMOUS AUTHOR(S)

ACM Reference Format:

1 Introduction

 This supplementary material provides additional details and results that complement the findings discussed in the main paper. We include further explanations of the methods, extra figures, and tables for clarity.

2 Mathematical definition of the used metrics

2.1 privacy metrics

• Jensen-Shannon divergence (JSD): The Jensen-Shannon divergence (JSD) is a symmetrized and smoothed version of the Kullback-Leibler divergence. It is defined as [3]:

$$\mathrm{JSD}(P,Q) = \frac{1}{2} \left(D_{\mathrm{KL}}(P \parallel M) + D_{\mathrm{KL}}(Q \parallel M) \right)$$

Where:

- $D_{KL}(P \parallel M)$ represents the Kullback-Leibler divergence from distribution P to M.
- P and Q are the two probability distributions being compared.
- *M* is the average distribution, defined as $M = \frac{P+Q}{2}$.
- Wasserstein distance (WD): The Wasserstein distance (WD) is defined as [2]:

$$WD(P,Q) = \int_{O} d(x,y) \gamma(x,y) d\gamma(x,y)$$

Where:

- $\gamma(x, y)$ is the optimal transport plan.
- d(x, y) is the distance between two points x and y in the probability space.
- Membership Inference Attack (MIA): We used the DOMIAS model, a density-based Membership Inference Attack (MIA) model proposed in [4]. This model detects local overfitting in synthetic data generators by comparing the densities of real and synthetic data distributions to infer whether a specific real sample was part of the training data. The membership score is computed as:

$$S(x) = \frac{p_{\text{gen}}(x)}{p_{\text{real}}(x)}$$

Where:

Manuscript submitted to ACM

- $p_{gen}(x)$ is the density of the synthetic data.
- $p_{\text{real}}(x)$ is the density of the real data.

A higher score S(x) suggests a greater likelihood that the sample x was used during training, especially in overfitted regions where the synthetic data mimics the real data closely.

• **K-anonymization:** K-anonymity is a property of a dataset that indicates the re-identifiability of its records. A dataset is k-anonymous if quasi-identifiers for each person in the dataset are identical to at least *k* − 1 other people in the dataset [1].

3 Results for Same Train, Same Test

3.1 Results Pertaining to RQ1

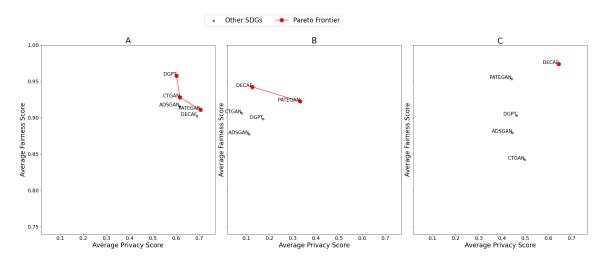

Fig. 1. Pareto frontier illustrating the trade-off between fairness and privacy. Red-labeled points represent optimal solutions, balancing both objectives, while gray points are suboptimal. The frontier highlights the trade-offs between improving fairness and preserving privacy.

Table 1. Fairness and Privacy for all Datasets. Boldened scores are the highest and those in red are the lowest.

	Dataset A		Datas	set B	Dataset C	
Data	Fairness	Privacy	Fairness	Privacy	Fairness	Privacy
Real Data	0.95	-	0.91	-	0.89	-
ADSGAN	0.92	0.62	0.88	0.11	0.88	0.44
CTGAN	0.93	0.62	0.91	0.08	0.84	0.50

Manuscript submitted to ACM

3.2 Results Pertaining to RQ2

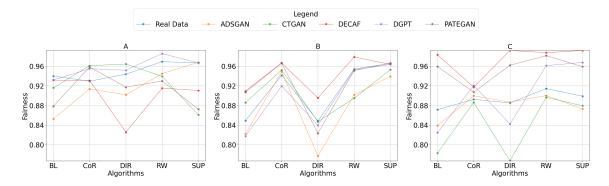

Fig. 2. The trend of fairness improvement or decline with respect to the baseline (BL) after the application of the 4 pre-processing fairness algorithms (i.e., CoR, DIR, RW, and SUP) for both real and synthetic datasets across all models. (Higher fairness is better): $Fairness = \frac{3-|ABROCA|-|ERD|-|TPRD|}{3-|ABROCA|-|ERD|-|TPRD|}$

Table 2. Percentage Change in Average Fairness Results Compared to Baseline Across Datasets and Synthetic Data for Dataset A, B, and C.

Table 35. Fairness and Performance results for all Models on Maths Dataset After DisparateImpactRemover Algorithm was applied

5 Additional Figures

5.1 Additional privacy evaluation results

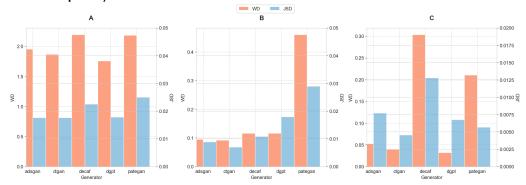

Fig. 3. distance and similarity metrics in privacy evaluation

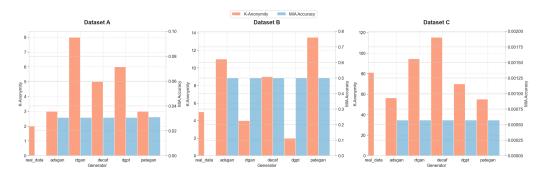

Fig. 4. re-identification risk assessment metrics in privacy evaluation

5.2 Additional fairness evaluation results

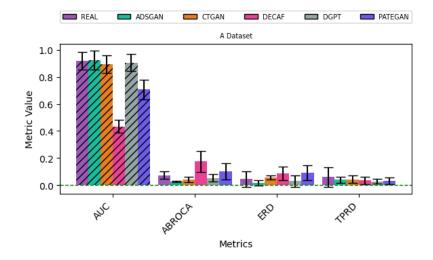

Fig. 5. Overall Fairness and AUC score for all Models for Dataset A. Bar heights denote average value of metric and the error bars indicate the standard deviation. Over here we just keep the fairness scores in their typical range without normalizing them (As reported in the main paper. Hence, fairness scores closer to 0 are the best and fairness scores closer to 1 are the worst. Note that we still Use the absolute values of the fairness scores. For the hatched AUC bars, the closer they are to 1 the better.

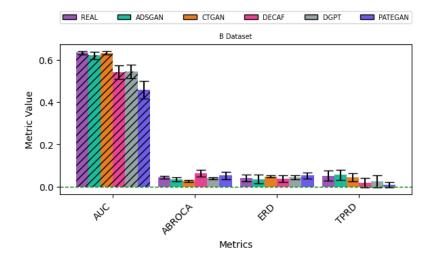

Fig. 6. Overall Fairness and AUC score for all Models for Dataset B. Bar heights denote average value of metric and the error bars indicate the standard deviation. Over here we just keep the fairness scores in their typical range without normalizing them (As reported in the main paper. Hence, fairness scores closer to 0 are the best and fairness scores closer to 1 are the worst. Note that we still Use the absolute values of the fairness scores. For the hatched AUC bars, the closer they are to 1 the better.

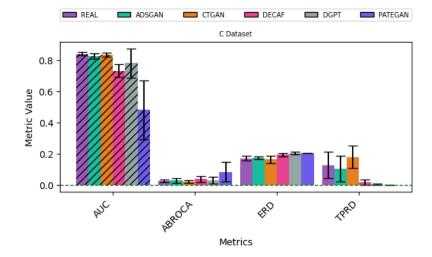

Fig. 7. Overall Fairness and AUC score for all Models for Dataset C. Bar heights denote average value of metric and the error bars indicate the standard deviation. Over here we just keep the fairness scores in their typical range without normalizing them (As reported in the main paper. Hence, fairness scores closer to 0 are the best and fairness scores closer to 1 are the worst. Note that we still Use the absolute values of the fairness scores. For the hatched AUC bars, the closer they are to 1 the better.
